

High-Voltage Type – Type HVR & HVA

ALUMINUM ELECTROLYTIC CAPACITORS

NITAI'S high voltage aluminum electrolytic capacitors are suited where needs miniature size, high CV product, low leakage and long operating life.

Rated voltages range from 160 V.DC through 450 V.DC.

Operating temperature range: -25°C~+85°C.

Capacitance and tolerance: Capacitance measurements shall be made by the bridge method at a frequency of 120^{+10}_{-5} Hz.

The capacitance shall be within the specified tolerance of $\pm 20\%$.

Leakage current: A current-limiting resistor of 1,000 ohms shall be connected in series with each capacitor under test. The DC leakage current shall be measured after rated voltage has been applied for a period of five minutes.

The maximum leakage current for any capacitor shall not exceed the value determined from the following equation:

$$I = 0.06CV + 10$$

where: I = Leakage current (UA)
C = Nominal capacitance (UF)
V = Rated DC voltage (V.DC)

Dissipation factor: Measured at a frequency of $120Hz^{+10}_{-5}$ Hz, the dissipation factor shall be less than the values in Table 1.

Table 1.

Rated Voltage (V.DC)	Dissipation Factor (%)
160 ~ 250	20
350~450	25

Low-temperature characteristics: The ratio of the impedance of -25°C to that of +20°C shall be less than the values in table 2.

Table 2.

Rated Voltage (V.DC)	$Z @ -25^\circ C$ $Z @ +20^\circ C$
160	4
200~250	8
350~450	20

Life test: Full rated DC voltage shall be applied to the capacitors through a series protective resistor (1,000 ohms) for a period of 1,000 hours ± 12 hours, while the capacitors are maintained at an ambient temperature of $+85^\circ C \pm 2^\circ C$ (shielded from direct heat radiation).

The capacitors shall then be removed from the test chamber and stabilized at room temperature and meet each of the values listed in Table 3.

Table 3.

Leakage current	Same as specified under the values mentioned in Leakage Current Item
Capacitance	Within $\pm 20\%$ of initial measurements
Dissipation factor	Less than 150% of values in Table 1.
Appearance	Free from leakage of electrolyte and/or other noticeable deformation

Shelf life test: Prior to testing, each capacitor in the test group is measured for capacitance, dissipation factor and DC leakage current.

The capacitors are then stored with no voltage applied at a temperature of $+85^\circ C \pm 2^\circ C$ for 1,000 hours ± 12 hours. Following this period the capacitors shall be removed from the test chamber and be allowed to stabilize at room temperature. Next they shall be connected to a series limiting resistor with DC rated voltage applied for 30 minutes after which the capacitors shall be discharged. After completion of these procedures the capacitors shall meet each of the requirements as listed in Table 3.
